1. The disclosure is objected to because of the following informalities: on page 1, line 22 of the specification, the comma should be deleted. On page 6, lines 5 and 10, "is" should be changed to --are--. On page 7, line 17, "other" should be changed to --another--.

Appropriate correction is required.

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 27-35 are rejected under 35 U.S.C. 102(b) as being anticipated by Kwak et al, cited by applicant.

Note Fig. 2, where the first and second input signals are X1 and X2; the recited first and second select signals are any one of the six top control signals and any one of six the bottom control signals received by the internal FETs with drains directly connected to the resistors; the reducing impedance step occurs when these FETs are turned on by the select signals; the first and second generated signals are the outputs of the top and bottom inverter

arrays; and the combining to generate an output signal occurs at the common (summing) node of said outputs of the top and bottom inverter arrays. The weighting phase relationship occurs due to the number of upper internal FETs and lower internal FETs that are enabled, i.e., if more of the upper FETs are enabled than the number of bottom FETs, then the x1 input signal will have a higher proportional weight on the output signal (signal Y).

3. Claims 1-26 are allowed.

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
